Track: Standard and Classical Arabic Track

Abstract: Andalusian muwashshaḥāt are an important part of Arabic poetic heritage, known for their beauty and rich language. However, their complex style and old vocabulary make them difficult for many modern readers to understand. This project presents ((Wishāḥ)), an artificial intelligence system designed to make Andalusian muwashshaḥāt easier to read and understand. The system uses natural language processing to analyze the poems, classify them by literary theme, and provide short introductions. It also explains difficult and archaic words in clear modern Arabic. By using artificial intelligence as a supportive tool, ((Wishāḥ))helps bridge the gap between classical Arabic poetry and today's readers, .making this heritage more accessible and engaging

Idea fields: Several sectors can benefit from the Wishāḥ project, most notably the education sector in schools and universities, cultural institutions, and academic research centers, as well as digital platforms focused on Arabic language and literary heritage, by providing intelligent tools that simplify and .enhance access to Andalusian muwashshaḥāt

Results: The developed AI model successfully generates Andalusian muwashshaḥāt based on the poet's name and poem title. It accurately classifies the text by literary theme, provides a brief introductory context, and explains difficult or archaic vocabulary in clear contemporary Arabic, enhancing accessibility and understanding of classical poetic texts.

Future Work: In the future, the Wishāḥ project aims to improve its accuracy in understanding Modern Standard Arabic, particularly classical and poetic heritage texts. Proposed enhancements include expanding the dataset to cover a wider range of Andalusian muwashshaḥāt and literary texts, and adding features to explain rhetorical imagery and literary styles, not only difficult vocabulary. The model may also be developed to generate educational exercises and comprehension questions, supporting the learning process and benefiting ..Arabic language students and researchers
